How to Grow Bush Lima Beans

Bush Lima Beans succeed well in almost any good garden soil but do best in a rich, well-drained, sandy loam. As seed is sensitive to cold and wet ground, it must not be planted until the soil has become quite warm and fairly dry. Plant the seeds, edgewise, eye down, 4 in. apart in rows 2½ to 3 ft. apart, and cover with 2 in. of fine soil. When the plants are well started, thin to stand 12 in. apart for large-seeded varieties and 8 to 12 in. for small-seeded varieties. Give frequent and shallow cultivation until blossoms appear, but do not cultivate or handle plants when they are wet. They may be eaten green, dried, canned or quickly frozen.

How to Grow Pole Beans

Beans should not be planted until danger of frost is passed and soil is warm. They do best if the vines are given support. Space 3 to 4 ft. apart each way. Place 5 or 6 beans around each pole, cover with 1½ inches of soil, and firm to assist germination. When plants are well started, thin to 4 of the strongest to a pole. A packet of seed for 15 poles, except Scarlet Runner, a packet for 8 poles. Pole Beans may also be planted 3 to 5 inches apart along a trellis or fence.

S. N. & S. Co's. BEANS, Stringless and Tender

Beans require a light friable soil with plenty of moisture. The soil should be made mellow and rich. A succession of sowings can be made from the first week in May until the middle of June. Sow in rows 18 to 24 inches apart and cover from 1 to 2 inches deep. Keep the pods picked and the vines well watered and the Beans will continue bearing longer. 1 lb will plant 150 feet of row.

S. N. & S. Co's. Peerless Onion Seed

(One ounce for 100 feet of drill; 4 to 5 pounds in drills per acre)

HOW TO GROW ONIONS FROM SEED

Sow seed as early in the spring as the ground can be worked, in rows 1 to 1½ feet apart. Cover the seed lightly. The soil best suited to grow onions is one that is reasonably fertile, well drained, and well prepared. If fully matured onions are wanted, thin the seedlings when 3 to 4 inches tall, to stand sufficiently far apart to develop without touching one another. The largest onions are produced by sowing the seed in hotbed early in January or February and transplanting seedlings to the open ground 6 inches apart. When the bulbs have reached maturity, bend down the tops to hasten ripening before the onions are harvested. Store in a dry, free-from-frost place over winter.

S. N. & S. Co's. TENDER GREEN PEAS

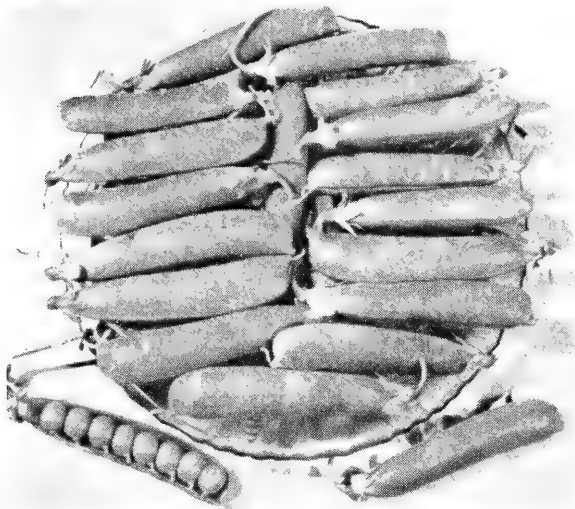

(1 pound to 100 feet of drill—80 to 100 pounds to the acre)

Peas are quite hardy and for early crop sow as soon as the ground can be worked. Then sow in succession every two weeks until the first of August. They require moderately rich soil but not too rich. Plant the dwarf varieties in rows 12 to 18 inches apart, and the tall varieties 3 feet apart. The tall varieties should be staked. By using various types and making several sowings of each, good Peas can be had for a long season. For late sowing, use Early Dwarf Varieties.

Do you know how to avoid the usual disappointment of a poor Pea crop after mid-July? It is easy to get a big crop of juicy Peas even up to late August. Instead of planting at two- or three-week intervals get Long-Lasting Pea Garden and plant all at the same time in early Spring. This will allow a good root system to develop before hot weather comes. The varieties will bear in the order shown to late August.

MODERN SPRAYERS FOR MODERN GARDENING WITH MODERN CHEMICALS

FAMOUS BRADSON SPRAYERS OFFER EVERYTHING EXCLUSIVELY BEST.

Functional Parts of Bradson Sprayers (and only Bradson) Will Not Pit, Corrode or Disintegrate. The exclusive molded Nylon spray heads plus Polyethylene gaskets and suction tubes withstand new insecticides and fertilizers that pit, corrode and destroy metals and commoner plastics.

Controlled Spray Pattern Gives Best Performance. The controlled fan shaped spray pattern of Bradson Sprayers eliminates side spray, most effectively mixes and distributes spray material at point of application. Fertilizer sprayers give 3 to 6 times the coverage at same water pressures.

Controlled Vacuum Results in Large Non-Clogging Suction Holes. Exclusive Bradson "Hydro-Lift" design produces a controllable vacuum, eliminates small easily clogged suction holes inherent in other sprayers. Bradson Suction Holes are Five Times Larger.

Michigan Peat * *It's Bacti-vated!*

BACTERIALLY ACTIVE *TRADE MARK REG

"NATURE'S FINEST SOIL BUILDER"

What Is the Value of PEAT in Gardening?

Peat is organic matter. As it decays it releases beneficial bacteria. It increases the capacity of soil to retain moisture. When mixed into soil peat gives it the ideal physical structure for growth of plant life. Physical structure of the earth is just as vital to growing things as plant food. Peat binds sandy soils, loosens clay soils, improves all soils. Peat makes fertilizer more effective by storing it up in tiny fibrous cells and then releasing it slowly to plant roots. Used as a mulch in summer, peat keeps the ground from caking and makes cultivation unnecessary. It keeps roots cool and moist during intense heat.

Why is "Bacti-vated" MICHIGAN PEAT a Vitalizing Force in Soil?

Michigan Peat is aerated and processed to build up its naturally high count of beneficial bacteria. This bacteria converts raw chemical fertilizers into a form that is digestible to plant roots. Helps to release plant food locked up in soil.

- Michigan Peat Has High Nitrogen Content
- Michigan Peat Binds Sandy Soils, Loosens Clay Soils
- Michigan Peat Enriches — Nourishes — Vitalizes
